# ShakeoutPro Jobsite Staging App Saves Time

When it comes to complex projects, we know you need to maximize efficiency during the layout and building process. ShakeoutPro, the jobsite staging app, was developed to help our Builders and Erectors save time receiving, unloading, and staging steel on your jobsite by providing a 3D model to illustrate the parts of a building and where they belong on the site. Simply scanning the part with the camera on your phone or tablet instantly highlights the part on your screen, allowing you to determine where to stage it for maximum efficiency.

### Unloading
Using the app can begin as early as when you're unloading the truck — scanning and placing the parts on the jobsite as you unload the parts from the truck. Other users find that it is more useful to unload the truck and then start the scanning process to determine where the pieces go.

### Easy Technology
There is no need to fear the technology of ShakeoutPro. The app is easily downloaded for either Apple (iOS 14 supported) or Android devices. Authorized Builders also can launch and load the app from your Toolbox app. Users are comfortable using the app on both smartphones and tablets, depending on what size of device you prefer on your jobsite. It is easy to learn and use, and can save users several hours on site.

### Load Multiple Phases at Once
When using the app, multiple phases can be loaded and active at one time. If your project has multiple phases, you can toggle each phase on and off, allowing you to easily interact with parts across all active phases.

*Don't have ShakeoutPro? Download it free from the App Store or Google Play. It can be used on any project where ShakeoutPro was included during the estimating process.*
